Abstract (en)

A device including at least one transformer (1) with primer (9) seconder (10) coil ratio more than one and including a control unit (2) used to control timing and magnetute of the primer current is employed to heat a metal workpiece (4) to be subjected a subsequent forming operation. An homopolar DC generator can also be used as current source for current heating preparing workpiece for forming operation. Subsequent heating, forming and cooling processes of the metal workpiece are carried out in a controlled manner by a central synchronization unit. This process can be applied in hot metal bulk forging, sheet forming and hot tube blowforming.
