Abstract (en)
A network system including a host having a first network module, and a first controller checking a data transmitting/receiving state of the first network module and outputting operation state data corresponding to the data transmitting/receiving state through the first network module, and a client having a display, a second network module connected to the host and receiving the operation state data from the host, and a second controller controlling the display to display information about the data transmitting/receiving state of the first network module of the host on the basis of the operation state data received through the second network module. With this configuration, embodiments of the present invention provide a computer, an access point, a network system and a control method thereof, where a host can provide data about its data transmitting/receiving state to a client, thereby allowing a user to check the data transmitting/receiving state of the host.
