Abstract (en)

[origin: US2006048330A1] The invention relates to a device for rinsing out and spin drying a wiping body, which is mounted on a wiping head of a surface cleaning device, comprising a container which has a rinsing region and a spin dryer region, a wiping head mount being mounted rotatably in the spin dryer region, into which wiping head mount the wiping head can be inserted together with the wiping body and which wiping head mount can be driven rotationally by means of a drive device in order to remove moisture from the wiping body, the rinsing region accommodating a cleaning fluid, and it being possible for the wiping head together with the wiping body to be inserted into the rinsing region. In order to further develop the device in such a manner that it has a particularly compact configuration, it is proposed according to the invention that the container is configured in the manner of a bucket which surrounds the rinsing region and the spin dryer region, that the container forms below the spin dryer region a dividing wall which covers a drive compartment accommodating the drive device, and that the rinsing region extends laterally next to the spin dryer region and the drive compartment, the rinsing region forming an insertion section level with the spin dryer region and a liquid-accommodating region level with the drive compartment.
