Abstract (en)

[origin: WO2004034336A1] The invention relates to an access control system comprising one or more autonomous devices (25), said devices (25) containing appropriate readers (3) for identifying a person and having at the same time a radio transceiver (4), which transmits data to a central radio transceiver (8). The data that has been read is subsequently verified with data that is stored in a computer. If the data matches, the door is released. The door is then locked again and the autonomous devices (25) revert automatically to a current-saving mode.
