Abstract (en)

[origin: FR2852452A1] The system has an annular spacer (6) associated to an electric conductor (1) on side directed towards a support component (2). The component provides a pin (3) for engaging in hole (4) of the conductor. A nut (5) is associated to the spacer by tubular sleeve (5a) allowing rotation of the nut with respect to the spacer. A course of the nut is determined by its axial movement between an assembly and a clamping position of the conductor.
