Abstract (en)  
[origin: WO2004049676A2] Methods and systems are described for remote establishment of a call from a first device to a second device. In said methods and systems the information is retrieved from the first device regarding the second device along with information associating the user with a device associated with the user. The call is then transferred to a switch associated with the user's device. The switch then forwards the call to the second device.
