Abstract (en)  
[origin: WO2004081473A1] The present invention relates to a refrigerator and/or freezer cabinet comprising an outer shell (10), an inner shell and at least one cooling system having at least one evaporator, at least one compressor and at least one condenser (13) between which a cooling agent is circulated through a cooling tube. Each of said evaporators is being positioned inside a cabinet space, said compressor being positioned in a compressor space (16) and at least one of said condensers (13) being mounted at the outer shell (10) on the rear side of said cabinet so that a condenser space is formed extending in a vertical direction between the outer shell (10) and the condenser (13). At least one opening of said compressor space (16) is substantially facing the rear side of said cabinet. In the present invention at least one covering plate (20) is being positioned at the rear side of said cabinet and at least partly covering said condenser, said plate (20) being mounted substantially in parallel with said rear side of the outer shell (10), sound absorbing means (21) being mounted between said plate (20) and said condenser (13).
