Abstract (en)

[origin: EP1604836A2] The method involves coloring and glittering an egg in such a manner, that particles are transferred from a foil to the egg shell. The transmission of the particles is provided by an adhesive applied on the egg. The coloring serves for the coloring and as adhesive. In a first step an egg is warmed up with and the adhesive color applied. Secondly, before cooling the foil is brought with the particle carrying side with the egg shell in contact, so that the particles are transferred. The color mass is liquefied when heated up and used as a gel basis. The color additionally contains solvents.
