Abstract (en)

An active-matrix display device in which a plurality of pixel circuits (P11-Pnm) are arranged in a matrix and positioned at intersections of data lines (DL1-DLm) and scan lines (SL1-SLn) extending in respective directions perpendicular to each other, and one of the pixel circuits is selected by one of the scan lines to store data provided by one of the data lines, characterized in that two electrodes for providing a power-supply potential and a ground potential, respectively, are connected to a given one (Pk1) of the pixel circuits, and one of the two electrodes is one (SLk) of the scan lines.
