Abstract (en)

[origin: WO2004040155A1] Disclosed is a bearing shell (1) comprising a metallic supporting material (2) which is coated with at least one sliding bearing material (3). At least one oil-bearing groove is engraved within the rear side of the supporting material (2). The inventive method for producing such bearing shells encompasses the following steps: a band made of a composite material is produced by coating one side of a metallic supporting material with at least one sliding bearing material; grooves are engraved into the bare supporting material of the band; strips of material are cut; said strips of material are shaped into bearing shells; and the inside of the bearing shells is machined, resulting in material being removed.
