Abstract (en)

[origin: WO2004079391A1] The invention relates to a device and method for controlling at least one deceleration device and/or an output-determining actuating element of a vehicle drive device, particularly in terms of an automatic vehicle longitudinal control. To this end, the inventive device is provided with: a first surroundings detection device that furnishes longitudinal value-optimized measured values; a second surroundings detection device that furnishes object lateral extension-optimized measured values, and; an evaluation device, to which the output signals of the first and second surroundings device are supplied, and both the measured values of the first as well as the second surroundings device are used for identifying objects. In addition, the device and method are suited for initiating or effecting a deceleration of the vehicle in order to avoid a collision or to minimize the gravity of the collision.
