Abstract (en)

[origin: US2006176148A1] The invention relates to a closing system (1), comprising a transmitter/receiver unit for the non-contacting operation of a door (2) or a gate, as well as to a method for its operation. In order to operate a door (2) or a gate, a transmitting code is transmitted by an authorized transmitter (3) to the receiver (4). The authorized receivers (3) are defined in that their transmitting codes can be read into the receiver (4) by means of a teach-in mode. The receiver (4) can be switched to the teach-in mode upon receiving an identification code from a freely selectable transmitter (3) if the number of transmitting codes for authorized transmitters (3), stored in the receiver (4), is below the limit value (N_G) predetermined for the receiver (4). The receiver (4) can be switched to the teach-in mode only upon receiving an identification code from an authorized transmitter (3) if the number of transmitting codes of authorized transmitters (3) that are stored in the receiver (4) corresponds to the limit value (N_G).
