Abstract (en)
[origin: EP1607556A1] The door handle is designed so that on the side of the grab handle (6) opposite the first swivel axis (4) a lever (14) which is swivel mounted on the grab handle during swivel movement moves the grab handle from the closed and rest position in which the grab handle closes flush with the body and/or grip housing into the operating position where the grab handle protrudes for actuation, and at the end of actuating the door moves it back into the closing position. The lever is mounted on the grab handle to swivel about a second swivel axis which runs parallel to the first.
