Abstract (en)

[origin: EP1608091A2] A method and apparatus for receiving information regarding the displaying of a service in a digital audio broadcasting (DAB) receiver via a fast information channel and for controlling the displaying of the service on the DAB receiver are provided. The method includes receiving a digital audio broadcasting transmission frame and parsing information regarding a sub channel and a service component related to a service selected by a user, and obtaining information required to display the selected service by parsing information from a channel that is differentiated from a data service channel. Accordingly, it is possible to display various types of services regardless of the DAB receiver used, thereby allowing effective use of a user interface.
