Abstract (en)

[origin: WO2004088439A1] Disclosed is a method for stabilizing machine processes, in which said machines are regulated in accordance with a machine regulation matrix selected among a plurality of machine regulation matrixes by using at least some detected machine sensor values, set-point regulation values of the regulated machines being stored in each machine regulation matrix. A process is optimized according to a predefined criterion by also using some of the machine sensor values such that a machine regulation matrix which is optimal according to the process optimization is determined from the plurality of machine regulation matrixes and is subsequently used for regulating the machines.
