Abstract (en)

[origin: WO2004089585A2] The invention relates to a method for producing board from cellulose-containing particles. The first stage of said method consists in mechanically cutting chips from cellulose containing material, drying said chips and, afterwards mechanically cutting them at least partially into micro-chips which are subsequently glued and finally in producing micro-chip plates from a micro-chip material. The inventive chipboard is produced at least in a parallel direction by pressing and heating from said micro-chip material. The board produced of said material is also disclosed. The invention makes it possible to produce a chipboard whose characteristics are similar to MDF board without using the expensive MDF production method.
