Abstract (en)

[origin: FR2853332A1] The bobbin placer and lifter consists of at least one yarn receiving cylinder (1) linked to a reciprocating mechanism (3) for winding the yarn bobbin (B) on a tubular support (4) retained by a holder and positioner (5), a dispenser (6) for the supports and a discharger (7) for the filled bobbins. The receiving cylinder and support tube are positioned for winding so they rotate with the yarn (2) passing under the receiving cylinder and over the support tube, and that the latter moves towards the discharger in a direction opposite to that in which the yarn arrives. The support dispenser is fixed, while the discharger is in the form of a ramp with the wound bobbin tending to roll down it when released. The holder is in the form of pivoted arms with forked ends (9, 10) that move as the size of the wound bobbin increases, releasing the bobbin on the discharger and picking up a new one as it travels in a circular trajectory.
