Abstract (en)

[origin: US2006049642A1] In this lock, comprising an opening lever ( 12 ) and a locking lever ( 16 ) capable of displacing a connecting rod ( 17 ) between a first position, in which the opening lever ( 12 ) can cooperate with the connecting rod ( 17 ) in order to cause the opening of the lock, and a second position which prevents the opening of the lock, blocking means ( 28, 29 ) are provided for preventing a displacement of the rod ( 17 ) between the first and second positions when the opening lever ( 12 ) is put into an opening position before the locking lever is actuated, and an elastic device ( 21 ) is provided which is capable of memorizing both an unlocking action and a locking action when the locking lever ( 16 ) is actuated while the connecting rod ( 17 ) is being blocked by the blocking means ( 28, 29 ), by storing, as appropriate, an unlocking energy or a locking energy in response to the actuation of the locking lever, in order automatically to cause an unlocking or a locking of the lock when the opening lever ( 12 ) returns into a position of rest.
