Abstract (en)

Each of the skis (1, 2) is equipped with a binding attached to the upper surface (2.2) of the board by locking elements engaging with undercut areas located along both sides of a longitudinal depression and forming an elevated border (11). The undercut areas are assembled of several pairs of complementary angle elements (13, 14) inserted into the space in front of the border (11). Small gaps (18) are created between each of the pairs (13, 14) resulting in a flexible characteristic of the board (1, 2).
