Abstract (en)
[origin: EP1612118A2] The method involves receiving vehicle license data and driving route data from point form active systems (2.1, 2.2) that are arranged at a distance from each other. Information about an information transmitting system independent from a safety system is received, so that new driving licence data is found in the point form active systems. The driving licence data at one of the active systems is recallable, through slow driving.
