Abstract (en)

The control device has an actuating element (16) mounted on the locking rod (15) to bias the brake element (13) as the locking rod moves in the closing direction of the gang casement (1). The actuating element moves to contact the brake element whereby the actuating element is displaced relative to the locking rod as the locking rod is braked. The brake element can be a brake lever (17) formed from two lever arms rigidly connected to one another whereby the brake lever can swivel towards the locking rod.
