Abstract (en)

Apparatus for measuring condition data for a rolling wheel set (14) of a railway rolling stock comprises at least one, preferably at least 2, contactless distance sensor (3) for determining the wheel flange height ( $S_n$ ) vertical to the under the passing wheel flange (5) next to the rail (4). The obtained distance value ( $S_x$ ) is supplied to an analysing device (4) which determines the wear ( $S_a$ ) of the wheel running surfaces (5) of the average wheel diameter (DL).
