Abstract (en)

The method involves dividing a log memory into first and second memory areas, storing corresponding data of an event in a first memory area until exceeding a threshold at the transition between the sub-memory areas, copying and compressing first data at least from the sub-memory areas in the lower address range of the first area until data compression is finished, storing compressed first data in the second area, clearing the first data at least from the sub-memory areas in the lower address range of the first area and moving second data from the sub-memory areas in the upper address range to an area in the lower range of the first memory area, whereby the moved data corresponds to the latest stored events. An independent claim is also included for an arrangement for implementing the inventive method.
