Abstract (en)
[origin: US2006229667A1] The device (10) comprises a stationary body (12), a pincer member (14) comprising first and second pincer branches (14 A, 14 B) mounted to move in the stationary body (12) between a rest position and a cocked position, return means (16) for resiliently returning the pincer member (14) to the rest position, and locking means (18) for locking the pincer member (14) in the cocked position against the return force of the pincer member (14), and releasable by means of a trigger member (20) that can be activated by a user. The device (10) further comprises blocking means (32) for blocking the pincer branches (14 A, 14 B) in a pinched-together position, which blocking means are active during a displacement stroke of the pincer member (14) between its cocked position and its rest position, without the user needing to maintain any action on the trigger member (20).
