Abstract (en)

[origin: WO2004090697A1] The invention relates to a method in data transmission data, where person-specific data is collected. In order to collect data, a person performs login with an identification means (5), to which a personal identifier (6) is connected. The collected data is transmitted to a processing device (3) for processing. In the method, a unique, one-way anonymous identifier (9) is formed on the basis of the data contained by the person's identifier (6). On the basis of the anonymous identifier (9), the person's identifier (6) and the identification means (5) remains unestablished. Said anonymous identifier (9) is used to confirm the collected person-specific data into anonymous data, in which case said anonymous data is transmitted to the collection device (3). The invention also relates to a system (1) where the method is applied, as well as to a collection device (2) to be used in the system.
