Abstract (en)

The user (2) of the arrangement (10) could be a ski-jumper with sensor elements (6) attached to each of the boards (4) assessing the speed (22), their angles and their position (24) in relation to each other. The obtained data are transmitted to an evaluation device (12) connected to the body of the user (2) in order to be compared with reference data. The data obtained during this process are transmitted to a second, external unit (14) using Bluetooth (RTM) technology and creating an instant feedback (16).
