Abstract (en)

[origin: WO2004096656A1] The invention relates to a closure cap (1) comprising a cap covering (2) and a cap base (3) in addition to an inlet (9) which is arranged in the base of the cap (3). Said inlet is closed by a membrane seal (4) which can be easily penetrated. Said closure cap also comprises a covering disk (7) which is arranged on the external side of the base of the cap (3) which covers the inlet (9) and the membrane seal (4). The aim of the invention is to produce a closure cap (7) which, according to a manipulation test, enables a container provided therewith to be refilled in a precise manner, and whose membrane can be penetrated and which is easier, faster and more simple for the user to recognise. According to the invention, the covering disk (7) is transparent in at least one area covering the membrane seal (4).
