Abstract (en)

[origin: EP1618965A2] The unit for the applying of a flowing liquid film over the width of a continuously pre-moved product sheet (6) has a time-activated pump and a liquid distribution unit with a liquid distribution chamber connected to the pump. The unit has two application devices (A,B) installed one behind the other and each with a pump by which they are supplied with liquid. The pumps of the two devices for the feed of the respective application liquid are controlled in such a way that the actual distance between the application devices with regard to the time-activated application activity is optimized in the sense of a shortened empty run for the product sheet. An independent claim is included for a control unit for the two application devices through which the region of the product sheet not wetted by one of the application liquids comes to only a few centimeters.
