Abstract (en)

[origin: WO2004098018A1] The invention relates to a device for transferring electrical energy between at least two units that can move relative to one another, for example, to a device provided in the form of a slideway or slipring. A moving pick-off is displaced over a slideway, which is situated along the path of motion, and is in contact with said slideway. According to the invention, the slideways are subject to loss and attenuate the transmitted signal whereby eliminating the need for additional terminating resistors on the slideways.
