Abstract (en)

An apparatus (1;61) for angular connection, with selectively variable angular amplitude, of tubular section bars (2;62) for the construction of window and door frames, comprising: rigid connection members (3;63), which have corresponding first ends (4;64), interconnected and mutually articulated and corresponding second ends (5;65), able to be removably fastened to the section bars (2;62) to be connected. The first ends (4;64) bear rotoidal coupling surfaces (6,7;66,67, shaped complementarily, which are obtained in the body of the connection members (3;63). The coupling surfaces (6,7;66,67) are able to be mutually coupled and uncoupled with a relative motion of said connection members (3;63), performed parallel to an axis of articulation (8;68) of said first ends (4;64).
