Abstract (en)
The procedure consists of placing the lead or lead alloy objects, such as nuclear reactor screen blocks, in contact with an alkaline aqueous solution, rinsing with water or an aqueous rinsing solution, followed by contact with an acid aqueous solution and rinsing again. The alkaline solution is of soda or potassium, preferably in a 30 per cent concentration and at a temperature of 60 degrees C, in which the objects are immersed for 10 to 80 minutes as it is agitated. The acid solution is of nitric or acetic acid of similar concentration, at ambient temperature, in which the objects are immersed for preferably 30 minutes. The final rinsing stage is followed by drying.
