Abstract (en)

[origin: FR2855344A1] The system has heterogeneous terminals (120) connected with a LAN (110). A computer server (102) has a processing unit (130) to determine a most appropriate context for information processing by the terminals. An external network (104) links the server with a master terminal (108). The server has a transformation module (140) to send an application to the terminal that permits the user to recover the context on the terminal. An independent claim is also included for a context management process of offering a most appropriate context to a user for information processing.
