Abstract (en)
[origin: EP1626126A1] The crash barrier (1) is supported on posts (3) at intervals at the edge of the roadway. The top ends of the posts hold continuous profiled horizontal rails (8) consisting of rail sections (7) able to deform when hit by a vehicle and held by bolts (10) in their overlapping ends (9). Bolts designed to break under load (6) hold the ends of the rail sections on the posts. A second continuous rail (16) is fastened to the posts under the first rail. It consists of series of flat rails (17) with bolted (18) joints midway between the posts. The rails have inwardly-turned flanges (20) and are bolted (24) to the posts with short pipe sections (23) acting as spacers.
