Abstract (en)

[origin: DE10233609A1] A total product (3) is generated for each cluster in an inference stage. As soon as the first zero (2b) appears in factors (1) belonging to it, which can be read out from a memory, array or a pointer list, the total product generation process is broken off. If a zero value occurs, then an a posteriori weight belonging to the cluster is set at zero.
