Abstract (en)
[origin: FR2851495A1] The printer has a stimulation unit (31) for provoking a joint controlled from a jet (30) in an intermittent manner based on electric command signals during an upstream joint position. The stimulation circuit equally provokes the controlled joint in a downstream joint position to emit continuous jet by a nozzle (29). The continuous jet emitted is transformed into electrically charged and uncharged ink drops (33, 43). The electric command signals are generated using a generator (32). An independent claim is also included for a process of printing using inkjet printer.
