Abstract (en)
[origin: WO2004109007A1] The invention concerns a rack for hanging out clothing to be dried, in particular laundry or towels, comprising at least one pair of mainly parallel, elongated, mating clamping elements, one end of each of which is fixed to the support, the mating clamping elements defining a narrow, slot-shaped space in between for the clamping of the laundry. The mating clamping elements of each pair can be styled as springs pre-stressed towards each other. It is also possible that several pairs of clamping elements are fixed to the support and the clamping elements of adjoining pairs are interconnected. Moreover the rack provides mediums for suspension of the support with the fixed clamping elements, at a certain distance from the ground, for instance in the shape of a collapsible stand or a number of suspension hooks.
