Abstract (en)

A fluid jet loom (1) performs a weft insertion process in which a retaining pin (8) retracts to release a weft yarn (4) stored in a weft measuring-and-storing device (5), a weft brake device (40) applies a braking force to the weft yarn (4) at a brake start timing ($t_3, \Delta t_3$) while the released weft yarn (4) is being inserted into a shed (17) by a jet from a main nozzle (10), and the retaining pin (8) projects to stop the weft yarn (4) and thereby finishes the weft insertion process. A remaining weft-insertion length (L_1) to a final weft arrival position is input beforehand to the weft brake device (40) as an input value, and the weft brake device (40) determines the brake start timing ($t_3, \Delta t_3$) on the basis of the remaining weft-insertion length (L_1) and applies the braking force to the weft yarn (4) at the determined brake start timing ($t_3, \Delta t_3$).
