Abstract (en)

[origin: EP1630330A1] The device has a movable unit that works together with another movable unit e.g. ball. The latter movable unit is moved along a path of transverse movement of a push device. The former movable unit is pivoted in a sliding position. A closing movement of a flank (2) is performed by moving the flank against a spring, so that the flank approaches a stopper (25) and pushes the latter movable unit to the stopper.
