Abstract (en)

[origin: EP1632452A2] The truck has a piston-cylinder system (30) for provision of a force for a relative loading of a lift frame (12), driver seat carrier (14), column (19) and fork seat carrier. A piston (32) is connected with one of the carriers. A cylinder (34) of the system is rigidly connected with the frame and column, such that a torsion axis and/or bending axis can be transferred from the frame and column on a longitudinal section of the cylinder. The torsion axis running in the longitudinal direction of the cylinder operates a torsion moment, tensile forces and/or pressure forces. The bending axis running orthogonal to the longitudinal direction of the cylinder operates bending moment.
