Abstract (en)

[origin: EP1634814A1] The method involves providing a flat pallet with a berth having multiple attachment units that are formed at a receptacle. A permanent absorbed deformation for a reversible plate is experienced by a storage space of the berth. The space is manufactured from a synthetic and has non-elastic ductile material. A pressure is applied over a specific limit value and a deformable plunger is impressed into the space with the pressure. Independent claims are also included for the following: (A) a flat pallet for a defined plane and/or vertical suspension of a reversible plate during transportation to a machining center (B) an application of a machining center for manufacturing and/or machining of a cutting plate, which is designed as a reversible plate for manufacturing of a flat pallet for a defined plane and/or vertical suspension of the cutting plate.
