Abstract (en)

[origin: EP1634983A2] In a cloth-shifting-type pile loom (1) that drives a take-up-side terry motion member (18) and a let-off-side terry motion member (7) individually with designated first and second electrical actuators (41, 42), respectively, the cloth-shifting-type pile loom (1) drives the first electrical actuator (41) and the second electrical actuator (42) in an asynchronous manner. A driving condition corresponding to each of a plurality of weaving conditions is set for at least one of the electrical actuators (41, 42) such that a magnitude of a difference in driving amounts between the electrical actuators (41, 42) varies depending on weaving operations performed under different weaving conditions. The driving condition of one of or each of the electrical actuators (41, 42) is changed when a weaving condition is switched to another weaving condition during a weaving operation.
