Abstract (en)
[origin: EP1635070A1] The electro-hydraulic control system for the load-carrying unit (V3) of a forklift truck has a pump (8) at a tank (T), with a supply line (9') and a tank line (11) and a rectifier circuit (35) holding a pressure with four non-return valves (39-42) and a diagonal (43). A proportional 2/2 path valve (25') is in the diagonal for the load lifting/lowering movements and a load pressure line (44) branches in the rectifier circuit for a load compensation system (L). The bridge is open on one side with three branches (36-38) with one connected to the supply line and one linked to the tank line. A non-return valve open to the tank line is moved selectively from the load pressure line between blocked and free settings. The load pressure line is incorporated in the load compensation, connected to a supply line feed control (Z).
