Abstract (en)
The case has a fastening device including two pairs of recesses (18a, 18b) to receive ends of two respective bars (19a, 19b). Two slides (6a, 6b) are associated to respective recesses pairs. Each slide is subjected to resilient action, exerted by leaf springs (11a, 11b), tending to hold the slide in a locking position in which the slide covers corresponding recesses pair for holding the ends of the corresponding bars in the recesses. Each slide is moved against the resilient action for permitting introduction and extraction of the ends of the corresponding bars in and from the corresponding recesses pairs. An independent claim is also included for a wrist watch including a watch case.
