Abstract (en)

[origin: FR2856031A1] The method involves transferring a split ring (2) in standby position, by a mechanism (7) constituted of seizure units (8A, 8B), till a position near a neck (5) of a scrolling container (6). The neck passes through a space defined between the isolated ends of the ring held in an open position by the units. The ring is released after supporting a surface of the neck inside it during scrolling of the container. An independent claim is also included for a device for automatic installation of a label holder or booklet.
