Abstract (en)

[origin: WO2005000004A2] The system of the invention includes an interface processor for receiving transaction data in a first data format identifying transactions concerning financial reimbursement claim information communicated between two entities. The system also includes a transformation processor for converting the received transaction identification data from the first data format to a different second more generic, easily processed and readable second data format thereby allowing for customization and extensibility for different users. The system further includes an indexing processor that uses predetermined information concerning the second data format to identify and extract index information from the re-formatted transaction identification data. The index information is used to locate and retrieve the archived transaction data from a data repository included as part of the system upon user request. The system also includes a storage processor for storing records representing the re-formatted transaction identification data and the associated index information in the data repository. A display processor is also included for initiating display of the re-formatted transaction identification information in the second data format in response to a user command.
