Abstract (en)

[origin: EP1640553A2] The device has a cavity (20) provided in an inner side of a lower end (19c) of a collar, so as to form a reservation that receives a longitudinal end with respect to aluminum rails, when the rails undergo thermal expansion due to their exposure to high temperatures. The cavity has a depth which is equal to half of maximum extension of the rails in the direction of the length of the rails. An independent claim is also included for a tunnel casing of a roller-shutter and comprising a closing device.
