Abstract (en)

[origin: EP1640825A1] An electrical device (6) includes a identification transmitter (14) having a first setting in which the electrical module (8) is in a non-operative state and which has a second state in which the electrical module is in an operative state. An identification detector (20) functions together with the identification transmitter (14) in the second state, in order to evaluate defined information from the information transmitter (14).
