Abstract (en)

[origin: WO2005002486A1] The invention relates to a rotating, sitting-up bed consisting of a height-adjustable base and a horizontal frame that is connected to the base by means of a rotating articulated element. Said rotating articulated element is used to rotate the horizontal frame about 90 degrees in relation to the vertical axis, the horizontal frame dividing into a rear section, a central part, a thigh section and a lower leg section. In the rotated position, said horizontal frame folds into a Z shape, the rear part rising from the central section upwards, and the lower leg part hanging downwards. Furthermore, a sliding mechanism ensures that the front edge of the thigh part, adjacent to the back of the knee, is raised by a few centimetres.
