Abstract (en)  
A multi-wall bag (12) that includes a profile closure (10) extending across the open mouth of the package such that the bag can be reclosed after initial opening. The multi-wall bag (12) includes a top panel (22), a bottom panel (24) and a pair of side panels joining the top and bottom panels, where each of the panels is a multi-wall construction having a plastic inner layer (46). The profile closure is attached between the top and bottom panels and preferably includes a slider device (66). The bottom panel of the package includes a closure flap (54) that extends past the top panel edge (56) and is folded to entrap the slider device between the outer layer (52) of the top panel and the inner layer of the closure flap. A tear member (98) is positioned between the profile closure and the bottom panel such that the tear member can be used to initially open the package.
