Abstract (en)
[origin: WO2005007544A1] Disclosed is a device for delivering small parts to a conveying unit (9), comprising a receptacle (2) that is designed for accommodating a major number of small parts and is provided with a bottom (3) encompassing an elongate recess (4), a slider (5) that is disposed in said recess and is provided with a top, essentially horizontal conveying groove (7) for receiving small parts, and a moving mechanism (6) for causing a relative movement between the receptacle (2) and the slider (5) such that the slider (5) can be moved relative to the receptacle (2) into a first position in which the bottom area of the receptacle (2) and the conveying groove (7) are adjacent to each other and into a second position in which the conveying groove (7) is raised to a specific height above the bottom area. The conveying groove (7) can be displaced by the moving mechanism from the second position into an inclined third position in which the conveying groove has an inclination that causes the small parts to be delivered.
